Everyone's looking for a better indicator.

I deleted mine.

One setup —> the 15-Minute ORB + PDH/PDL —> has produced countless 100%+ SPY trades. No scanner, no signal service, nothing else.

The edge was never the setup. It's knowing an A from an A+.

Here's exactly how I trade both:

46 11 4 20

no_risk_no_premium 17h · Author

The 4 levels I mark every single day:

• PDH = Previous Day High
• PDL = Previous Day Low
• ORB High = High of the first 15-minute candle
• ORB Low = Low of the first 15-minute candle

That's it.

No fancy indicators.

No magic settings. Just price and key levels

Why PDH & PDL matter:

Because institutions watch them.

They're some of the most respected levels in the market.

When a 15-minute ORB break aligns with PDH or PDL, you're stacking multiple forms of confirmation together.

That's where momentum often accelerates.

My process is simple:

1. Mark PDH & PDL before the open
2. Let the first 15-minute candle form
3. Wait for the ORB break
4. Wait for the retest
5. Enter on confirmation

The retest is where the edge lives.

Most traders chase the break.

I wait for confirmation.

A+ BEARISH SETUP

✓ ORB breaks below the low
✓ Price is trading below PDL
✓ Retest fails
✓ Sellers step in

Puts.

Same concept.

Everything is aligned to the downside.

These are the days that can produce monster moves.

The difference:

A+ Setup
= ORB Break + PDH/PDL Alignment

A Setup
= ORB Break without full alignment

Both can work.

One simply has more fuel behind it.

Risk management is non-negotiable.

My stop goes below the retest on calls.

Above the retest on puts.

If the level fails, I'm out.

No averaging down. No hoping. No praying.

The market is always right.

no_risk_no_premium 17h · Author

When do I skip?

• Price trapped between PDH & PDL
• Choppy open
• No clean retest
• Wild price action with no structure

No setup is a setup.

Cash is a position.

Most traders don't have a strategy problem.

They have a patience problem.

The edge isn't the ORB.

The edge is waiting for confirmation.

Wait for the break.
Wait for the retest.
Wait for the market to prove itself.

something nobody tells you about the first 30 minutes of $SPY.

it's not for catching the move.
it's for understanding the day.

where did SPY gap open relative to yesterday's levels?
is it above PDH? that's bullish bias.
below PDL? bearish bias.
trapped between both? choppy. be careful.

how fast is it moving?
a $2 move in the first 10 minutes is a completely different session than a $0.30 drift.

which levels is it approaching first?
that's where your first setup is going to come from.

$SPY
$747 CALLS
EXPIRATION 7/27/2026
$.58 Entry

- seeking for an extension into $747.1-$747.4 range for a upper band gap fill. Be cautious for rejections once gap is fulfilled.

- be a responsible trader & don't oversize

the whole $SPY 0DTE path. in order.

step 1: clean chart. price and RSI only. nothing else.

step 2: mark PDH, PDL, PMH, PML before the open.

step 3: identify the 2-3 whole dollar levels closest to current price.

step 4: determine bias. above PDH = bullish. below PDL = bearish.

step 5: wait for first touch of a level. not second. not third. first.

step 6: confirm with RSI. above 70 for puts. below 30 for calls. no extreme, no trade.
